Explanation of Changes:

- Input Validation is_valid_row() ensures required fields (like email) are present.
- Error Logging: log_error() appends errors to error_log.txt.
- Robust Request Handling: Includes try-except to catch network/API errors.
- Modular Design: Functions are clearly separated for readability and testing.

Suggestions for Future Improvements:

- Validate email format using regex.
- Add retry mechanism with exponential backoff.
- Use logging module instead of manual file writes.
- Unit tests for validation and API logic.
